SIP Registration Platform

- Customer PBX controls where inbound calls should be delivered too.
- Customer PBX must handle mechanism to REGISTER their active system to our services.
- Recommended interval is every 5 minutes/300 seconds.

- Oracle SBC pairs run in a highly-available cluster; during failover, calls remain stateful over the pair and would continue without disruption to signalling or media flow
- The AWS Proxy pair runs in a highly-available cluster; during failover, calls remain stateful over the pair and would continue without disruption to signalling or media flow

- Beyond the AWS proxy, connections from customer PBXs are balanced over 4 Active Nodes split across 2 physical data centre locations.
- Individual nodes can be removed from active service during maintenance windows to limit customer impact
